

14. BRASAVŌLĀ *grandiflōrā* ; folio (plano ?) angustè lanceolato rigido labello maximo subrotundo-quadrato acuminato ungue longiore, sepalis petalisque linearibus acuminatissimis.

Flowers of this, which is much the finest species of *Brasavola* yet known, have been lately received from Honduras by the Hon. W. F. Strangways. The limb of the labellum, which is white, is considerably larger than a half-crown, and the sepals and petals are nearly three inches long. Those who have commercial relations with Belize should make a point of obtaining this beautiful plant from their correspondents. It resembles a gigantic specimen of *Br. nodosa*.
