

## NEW GARDEN PLANT.

---

### CATASETUM SERRATUM.

*C. serratum*; labello carnosio galeato resupinato subcompresso postice sensim saccato apice integerrimo emarginato lateribus latè sejunctis argute denticulatis, cirrhis haud columnâ longioribus.

Nearly allied to *C. maculatum*, from which it differs in the sides of the lip not curving inwards, in the shortness of the columnal cirrhi, and in the emarginate apex of the lip. The flowers are of nearly the same size, but not spotted; they are pale green, with the convexity of the lip yellow. Sent from Panama to Messrs. Veitch by Mr. Lobb. We received it from Exeter in September, 1845, with a statement that it is "a most abundant bloomer, having long spikes with from ten to twelve flowers on each spike, and powerfully scented."
